This sequence is derived from the reactive loop of antithrombin-II (AT-III), which is a natural serpin. The serpin does not inhibit activated protein C (aPC), does not require activation by heparin, and includes a target sequence (such as thrombin to inhibit activity. The inhibitor protein can be used as antithrombotic, or anticoagulant agents for treating or preventing antithravascular coagulation (DIC), unstable angina, anyocardial infarction, thrombotic stroke, thrombosis, pulmonary embolism, or other clotting disorders. When this protein is labelled, it can be used in diagnosic assays to determine the presence of serine proteases, especially thrombin. The protein has the same specificity as AT-III, but does not need to be administered with heparin, and is approximately 1500

AAR96938-R96946 represent muteins of alphal-antitrypsin (ATT). These sequences are used as base protein moieties in the serine protease inhibitor (serpin) protein of the invention. The serpin also contains a target sequence derived from the reactive loop of a natural serpin. The target sequence is preferably derived from the reactive loop of antithrombin-III (AT-III), and has the sequence shown in AAR96937. The

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and for the combinant production of (II). The card for chromosome and gene mapping, and in recombinant production of (II). The card dentifying expressed genes. (I) is useful in gene therapy techniques of the restore normal activity of (II) or to treat disease states involving or card trating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical card polypeptide and polymucleotide sequences have applications in the polypeptide and polymucleotide sequences have applications in the produce other types of deat and products dependent on DNA and cand to produce other types of deat and products dependent on DNA and ampostic amino acid sequences of the invention.

Configuration but was obtained in electronic format directly from WIPO configuration in the printed and polymucles.

The present sequence is that of a portion (see also AAM50881 and AAM50883) of the heavy chain of a recombinant Fab antibody fragment (Clone C) that binds tightly to denatured bovine PrBSc but not to the native conformation of the same protein in CD10 formatted ELISA. Prior infection. The Clone C Fab was generated against the 96-105 prion infection. The Clone C Fab was generated against the 96-105 region of bovine prior protein (PrP). Fab C reacts exclusive of region of bovine prior into protein (PrP). Fab C reacts exclusively from mouse CDNA and cloned into a vector that expressed human-mouse crown and cloned into a vector that expressed human-mouse connection in Escherichia coli. The purified Fabs were labeled with Buropium, giving an Fab designated Eu-(HuM)Fab C. This is an example of antibodies of the invention that specifically bind with a high degree of binding affinity to a native ungulate PrPC in situ and/or a denatured ungulate PrPSc, but not to a native ungulate of PrPSc in situ. The antibodies may specifically bind to epitopes of PrPSc in aitu. The antibodies may specifically bind to epitopes of proteins from in or more species of ungulates. The antibodies may pecifically bind to epitopes of proteins from in or more species of ungulates. The antibodies are useful for the detection of prior infection in ungulates.

The proteins and a pharmaceuticals (from natural sources), food, connectics such as pharmaceuticals (from natural sources), food, commetics etc. The antibodies can be used to screen foot the presence of PrPSc in the design of the presence of PrPSc in the compound that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel antibody useful for detecting infectious prions, particularly pathogenic scrapie isoform of the prion protein, PrPSc in an ungulate, especially cow, binds to native ungulate prion protein C in situ
                                                                                                                                                                                                                                                               Anti-bovine prion protein peptide antibody heavy chain fragment.

27-MAR-2000 (first entry)

Human antithrombin III variant FF (residues 385-393).

Human, antithrombin III, ATIII variant FF; elastase-resistant; IgG activated neutrophil resistant; anti-thrombin activity; heparin; anti-factor Xa activity, blood clotting disorder; sepsis; trauma; stroke; thrombin activation-related pathological symptom; restenosis; thrombosis; acute respiratory distress syndrome; thromboembolism; reocclusion.

Homo sapiens. Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Proc. Natl. Acad. Sci. U.S.A. 93:10928-10932(1996).
-!- FUNCTION: Eliminates the production of nonsense-containing RNAs.
- Essential for embryonic viability.
- ESSENTIAL LOCATION: Cytoplasmic.
-!- SUBGELLUDAR LOCATION: Cytoplasmic.
-!- SIMILARITY: BELONGS TO THE DNA2/NAM7 HELICASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        "Mammalian orthologues of a yeast regulator of nonsense transcript stability.",

Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch). ö -!- COFACTOR: P700 is a chlorophyll A dimer, A0 is chlorophyll A, A1 is a phylloquinone and FX is a 4Fe-4S iron-sulfur center.
-!- SUBUNIT: A psaA/B heterodimer binds the P700 chlorophyll special pair and subsequent electron acceptors. The PSI reaction center of higher plants and algae is composed of one at least 11 subunits.
-!- SUBCELLUMAR LOCATION: Integral membrane protein. Chloroplast Chloroplast.

RESPONSE CONSISTENT WITH THE NONVISUAL FUNCTION OF PINEAL PHOTORECEPTION.
PHOTORECEPTION. 

-1- SUBCELLULAR LOCATION: Integral membrane protein.
-1- TISSUB SPECIFICITY: PINEAL GLAND.
-1- PTM: SOME OR ALL OF THE CARBOXYL-TERMINAL SER OR THR RESIDUES MAY
BE PHOSPHORYLARDED (BY SIMILARITY).
-1- MISCELLANEOUS: THIS OPSIN HAS APPROXIMATELY AN ABSORPTION MAXIMUM
AT 470 NM.
-1- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
-1- SIMILARITY:

                                                                                                                                                                                                                                                                                                                               Sequences AAY04742-Y05000 and AAY07201-Y07204 represent secreted proteins from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the isolation of novel Corynebacterium glutamicum genes (AAS96073-AAS96132) encoding metabolic pathway (WP) proteins. The metabolic pathway proteins of the invention include enzymes involved in the lysine and methionine biosynthetic pathways. The polynucleotide sequences of the invention can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding metabolic pathway proteins from Corynebacterium glutamicum, useful for producing methionine and lysine in Corynebacterium and Brevibacterium -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Schroeder H, Zelder O, Haberhauer

Corynebacterium glutamicum; homeostasis; adaptation; HA protein; fine chemical production; organic acid; proteinogenic amino acid; nonproteinogenic amino acid; puteinogenic amino acid; nucleotide; primidine base; primidine base; mucleoside; nucleotide; lipid; asturated fatty acid; unsaturated fatty acid; dischopudate; aromatic compound; vitamin; cofactor; polyketide; diol; carbohydrate; aromatic compound; vitamin; cofactor; polyketide; enzyme; diagnosis; Corynebacterium diphtheriae; genetic engineering;
for the large-scale production and/or modulation of expression of fine chemicals such as lysine and methionine. The sequences of the invention may be used to identify C. glutantcum and related organisms e.g. C. diphtheriae in a subject to detect diphtheria. AAU71863-AAU71802 represent the novel C. glutamicum metabolic pathway proteins of the invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C -!- FUNCTION: This is the catalytic component of the active enzyme,

which catalyzes the hydrolysis of atp coupled with the exchange of

sodium and potassium ions across the plasma membrane. This action

creates the electrochemical gradient of sodium and potassium,

providing the energy for active transport of various nutrients.

C -!- SUNITI: CANTINITY: ATP + H(2)0 + Na(+)(In) + K(+)(Out) = ADP +

-!- SUBUNIT: COMPOSED OF THREE SUBUNITS: ALPHA (CATALYTIC), BETA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Shull M.M., Lingrel J.B.;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

US-09-252-991A-27570

Squence 27570, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT PILING DATE: 1999-02-18

PRIOR PILING DATE: 1998-02-18

PRIOR PILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR PILING DATE: 1998-02-18

```
cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoissis regulating activity, tissue growth factor activity, immunomodulatory activity and excitvity, infinibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                  Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; immune, haematopoietic; immune/haematopoietic antigen; cancer; cytostatic; gene therapy; vaccine; metastasis.

human secreted proteins, and encode the proteins given in AAV12897 to human secreted proteins, and encode the proteins given in AAV12897 to AAV13219, respectively. The proteins given represent the signal peptide and an N-terminal fragmen of a secreted protein. The mucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, call profiferation/differentiation activity, haematopoies's regulating activity, issue growth regulating activity, reproductive hormone regularing activity, enceptor/ ligand activity, anti-inflammatory thrombolytic activity, receptor/ ligand activity, anti-inflammatory calvity, tumour inhibition activity or other activity, anti-inflammatory calvity, the sequences can also be used for obtaining corresponding promoter. The sequences can also be used for obtaining corresponding promoter directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a cell.
which may have cytokine, immune, regulatory, haematopoiesis regulating, anti-inflammatory or tumour inhibition activity
                                                                                 Claim 34; Page 457; 577pp; English.

Drmanac RT Liu C, Tang YT,

WPI; 2001-514838/56. N-PSDB; AAI82081. Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune disorders

Claim 20; SEQ ID NO 16042; 1399pp + Sequence Listing; English.

ů The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA0013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other oycokines in other cell populations. The polynucleotides and polynpeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. inflammation. 889888888888888888888888

Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer -

Claim 11; Page 1612; 2338pp; English.

AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antilifective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen

RESULT 1 4AY44477

AAY44477 standard; peptide; 9 AA

AAY44477;

(first entry) 27-MAR-2000

Human antithrombin III variant Aa (residues 385-393).

Human, antithrombin III, ATIII variant Aa; elastase-resistant; IgG activated neutrophil resistant; anti-thrombin activity; heparin; anti-factor Xa activity, blood clotting disorder; sepsis, trauma; stroke; thrombin activation-related pathological symptom; restenseis; thrombosis; acute respiratory distress syndrome; thromboembolism; reocclusion. 

Homo sapiens. Synthetic.

distribution, and estrogen induction of mRNA.";

Gene 59:241-251(1987).

-!- FUNCTION: APOLIPOPROTEIN E IS A MAJOR PROTEIN CONSTITUENT OF CHYLOMICREONS, VLDL AND LDL. IT FUNCTIONS AS A RECOGNITION SIGNAL FOR THE CELLULAR BINDING AND INTERNALIZATION OF LDL PARTICLES BY THE APOBLE RECEPTOR.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR IS INCREASED FIVE- TO SEVEN-FOLD IN LIVER BUT IS UNCHANGED IN INTESTINE AND KIDNEY.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the mucleic acid cited above or fragments between nucleotides 8-100 of a sequence not defined in the specification, for amplifying a target sequence contained within a Streptococcus nucleic acid sequence, where the first primer is substantially complementary to the target sequence, and where the parts of the target sequence, and where the parts of the brimers having substantial complementary to the target sequence, and where the parts of the primers having substantial complementarity define the termini of the target sequence to be amplified, assay comprising contacting a test compound aving substantial complementarity define the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, mucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for companying immunodominant proteins. The methods are useful for companying expressed by the identified coding regions from the Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. genomic sequence Sequence

Streptococcus pneumoniae proteins and related DNA - useful for screening compounds for antibacterial activity

Claim 5; Page 460; 640pp; English

This invention describes novel isolated Streptococcus pneumoniae polymucleotides (see AAZ96173-Z96494) and their encoded proteins (see PAX96792-Y86482). The DMA, vectors and host cells described in the method of the invention are useful for the recombinant expression of the polypeptides. The polypeptides are useful for the resument or prevention of such a polypeptide. They can also be used to expression or activity of such a polypeptide (or DNA encoding them, via gene therapy) are also useful for inducing an immunological response in a mammal. The antagonists are useful to inhibit such bacterial polypeptides. The polypeptides for useful to inhibit such bacterial polypeptides. The polypeptides are useful to inhibit such bacterial polypeptides. The polypeptides are useful to determine their compounds and antibiotics. They are also useful to determine their role in pathogenesis of infection, dysfunction and disease.

Structural maintenance of chromosome 3 (Chondroitin sulfate proteoglycan 6) (Chromosome sequencin protein SmcD) (Basement membrane-associated chondroitin proteoglycan).
(Basement membrane-associated chondroitin proteoglycan). SEEPTHAN

Rattus norvegicus (Rat).

**SMEDILITY Forms a heterodimer with SMCILI or SMCIL2 in cohesin complexes. Cohesin complexes are composed of the SMCI (SMCILI or SMCIL2) and SMC3 heterodimer attached via their hinge domain, RAD21 which link them, and one STAG procein (STAG3), which link them, and one STAG procein (STAG3), which interacts with RAD21. Also found in melosis-specific cohesin complexes. Interacts with NUMA1, and forms a ternary complex with KIF3B and KIFAP3. Suggesting a function in tethering the chromosomes to the spindle pole and a function in chromosome movement. Interacts with MXI1, MXD3 and MXD4 (By similarity).

Interacts with SYCP2.

SUBCRILUTAR LOCATION: Nuclear protein. Associates with chromatin. Before prophase it is scattered along chromosome arms. During probably because of phosphorylation by PLK, except at centromerse, where cohesin complexes remain. At anaphase, the RAD21 subunit of the cohesin complexes remain. At anaphase, the RAD21 subunit of the complex from chromosomes, allowing chromosome separation (By mitters and processed and process MEDINE-2019364; PubMeda-10652260;

Complex is required for the cohesion during cell cycle and in DNA repair. Central component of cohesin complex. The cohesin complex is required for the cohesin complex. The cohesin complex apparently forms a large proteinaceous ring within which sister chromatids can be trapped. At anaphase, the complex is cleaved and dissociates from chromatin, allowing sister chromatids to segregate. The cohesin complex may also play a role in spindle pole assembly during mitosis (By similarity). Wu R.-R., Couchman J.R.; "couchman J.R.; "cond condroitin sulfate "cond cointing of the basement membrane chondroitin structure including protecoglycan core protein, bamacan: a five domain structure including coiled-coil motifs"; Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Rattus. -i- TISSUE SPECIFICITY: Ubiquitous.
-i- DAMAIN: The flexible hinge domain, which separates the large intramolecular coiled coil regions, allows the heterotypic intramolecular coiled coil regions, allows the heterotypic interaction with the corresponding domain of SMCILI or SMCILI, forming a V-shaped heterodimer. The two heads of the heterodimer are then connected by different ends of the cleavable RAD21 protein, forming a ring structure (By similarity).
-i- SIMILARITY: Belongs to the SMC family. SMC3 subfamily.
-i- CAUTION: Was originally isolated (Ref.1) as a proteoglycan protein function is not clear.

```
The present sequence is from an antithrombin III (ATIII) variant, 7EVEA derived from human ATIII N135A cDNA insert of the pBlueaco baculovirus expression construct and comprises residues 185-193. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities It may be expressed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-related pathological symptoms due to Sepsis, trauma, acute respiratory distress syndrome, restenosis, thromboens, thromboensolism and stroke It can also be used to reduce the risk of reocclusion and restenosis in percutaneous transluminal coronary angioplasty, and restenosis associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The present sequence is from an antithrombin III (ATIII) variant, 13.A derived from human ATIII N135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be expressed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIE with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-related pathological symptoms due to sepsis, trauma, acute captratory distress syndrome, restencials, thrombosis, thromboembolism and stroke It can also be used to reduce the risk of reocclusion and restencial precutational transmission in percutamencial renal manal coronary angiplasty, chrombosis associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
                                                                                                                                                                                                                                                                                                                                                 New modified human antithrombin III compounds, used for treating e.g. sepsis, trauma, acute respiratory distress syndrome, restenosis, thromboembolism or stroke -

```

The present sequence is from an antithrombin III (ATIII) variant, 13.D derived from human ATIII.M135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be expressed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-respiratory distress syndroms due to sepsis, trauma, acute respiratory distress syndrome, restenosis, thrombosis, thromboembolism and stroke. It can also be used to reduce the risk of reocclusion and stroke in percutaneous transluminal coronary and/opiasal surgeruntaneous transluminal coronary and/opiasal surgeruntaneous transluminal coronary and/opiasal surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients. Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy -

Claim 20; Page 755-756; 765pp; English

The invention relates to novel human secreted polypeptides. The colypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying at herapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the mucleic acids encoding the polypeptides and cells genetically, engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis, and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation, as anti-inflammatory agents; and in treatment of leukaemias. AAUS310+AAU3334 represent the amino acid sequences of novel human secreted proteins of the invention.

New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides

Example 5; Page 110; 2038pp; English

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8413 oligonuclectides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual or monitoring response to treatment in an individual or monitoring response trejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematous, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection. The present sequence is that of a human leukocyte expressed protein related

Novel transcription factor gene which encodes transcription factor protein that targets promoters of genes encoding seed storage proteins are useful for modulating seed storage protein expression in dicot seed

Disclosure, Columns 27-30; 67pp; English.

The invention relates to an isolated transcription factor gene which is expressed in a recombinant maturing dicot seed and which encodes a transcription factor protein which targets a promoter of a gene encoding seed storage proteins, lectins or oil-body proteins. The transcription factors isolated are Pv-Seed factor-1 (ROM1) and Vicilin-box binding protein-1 (ROM2). These factors bind to 7S-globulin (b-phaseolin) or lectin (PHA-L) promoters. The transcription factor gene is useful for enhancing or reducing expression of seed storage protein, lectin or oil-protein genes in dicot seed crops. The present sequence represents

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TILE OF INVENTION: Methods Of Ex-Vivo Expansion Of Hematopoietic Cells
Using Multivariant (IL-3) Hematopoiesis Chimera Proteins
NUMBER OF SEQUENCES: 197
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bauer, S.
